

NETWORK INFRASTRUCTURE

Build a Solid Foundation.

*At **Kolb+Co.**, we identify the proper technology foundation that will allow your business to run more efficiently. An effective technology foundation requires proper design and implementation of all facets of the solution: hardware, software, people and processes.*

+ Needs Analysis

Understanding your needs will help to develop the proper foundation. We examine the requirements of applications, network traffic, the amount of data storage, and many other key factors. We help you find this information to determine what you will need in the future.

+ Design

After pinpointing your present and future needs, we will design a full infrastructure solution for you that will be sufficient today and will grow with your business. Not only will we create the final plan, we will develop a detailed process to achieve your goals.

+ Implementation

Based on the design and detailed plan, we will implement the solution. Our experts will manage the project and incorporate your staff whenever appropriate in order to ease the transition and improve buy-in from those using the systems.

+ Business Continuity

All proper solutions should include a Business Continuity Plan. Disaster recovery is only part of the plan. Wouldn't it be better if your systems and the procedures surrounding them were designed to help you avoid disaster?

+ Training

Proper user training is a key component of a productive network and application infrastructure. If your employees know how to use your systems, they will be more likely to use them correctly, which will decrease problems and the ongoing costs of lost productivity and technical support.
